

Amendments to the Specification:

Please replace the paragraph beginning at page 1, line 22, with the following amended paragraph:

Although these ridges and valleys can provide many benefits to the resulting paper web, problems sometimes arise when the paper web is incorporated into a paper product. For example, a rolled or stacked paper product containing multiple layers of a paper web having ridges and valleys can possess a certain degree of "nesting". Specifically, "nesting" occurs when the ridges and valleys of one layer are placed adjacent to corresponding ridges and valleys of another layer, which causes the roll (or stack) to become more tightly packed, thereby reducing roll bulk (increasing density) and making the winding of the product ~~[[more]]~~ less consistent and controllable. For example, referring to Fig. 3, one example of a nested paper product is illustrated.
